Update on hydraulic stimulation of Amungee NW-1H

29 September 2016 - Falcon Oil & Gas Ltd. (TSXV: FO, AIM: FOG, ESM: FAC) is pleased to provide the following technical update regarding the hydraulic stimulation of the horizontal Amungee NW-1H well in the Beetaloo Basin, Australia.

Highlights of preliminary results from the Amungee NW-1H horizontal exploration well:

- Completion of 11 hydraulic stimulation stages along the 1,000 meter horizontal section in the Middle Velkerri B shale zone
- Stimulation treatments were successfully executed, with 95% of programmed proppant placed
- Flow back of hydraulic fracture stimulation fluid to surface continues
- Early stage gas flow rates through the 4.5” casing are encouraging
- The rates regularly exceed 1 million standard cubic feet per day (“MMscf/d”), and consistently range between 0.4 - 0.6 MMscf/d
- A workover rig is being mobilised to run production tubing and to commence an extended production test

Philip O’Quigley CEO of Falcon commented on the results:

“Preliminary results of the first horizontal exploration well in the Beetaloo are very encouraging. The planned testing programme utilising a production tubing string aims to evaluate the potential gas flow rate of the well.

We look forward to updating the market when further results become available.”
